APT

Algorithm Practice Tool

APT is a simple Python script that randomly selects a text file in `algorithms/` and generates a corresponding unsorted array of numbers of size $4 \leq n \leq 8$.

APT was designed and deployed on Linux, with no testing done on Windows. Some support for Windows has been appended, albeit based on poorly documented code. Worst case scenario, you could write a batch file to run something like `python APT.py; #print out.txt`

The printer name will need to be manually configured per network, regardless of OS.
